

Eco Frames

The ECO Frame is quickly gaining popularity in the textile screen printing industry. ECO Frames are constructed from a superior grade of aluminum for strength, consistency, and durability. All that combined allows the frames to stretch and hold mesh tension. The frames will meet or exceed manufacturers' specs and will be as good, if not better than, the static frames currently on the market.

Static aluminum frames have dominated the market for their lightweight feel and overall efficiency. ECO Frames will not only be light and effective, they'll also create a more productive workflow because it provides a system where broken mesh panels can quickly and easily be swapped out or replaced. Remeshing an ECO Frame is done in a matter of minutes (exceptionally fast compared to static screens, which takes weeks to ship the old frames, waiting for them to be shipped back). No more waiting around; you can put your frames back into production swiftly and efficiently.

Replacing mesh panels is a process that increases your green footprint. You no longer need to buy and ship replacement screens, or ship old frames out to be remeshed and shipped back to you. Not to mention, the ECO Frames and ECO Panels are BOTH 100% recyclable!

Characteristics

- 100% recyclable aluminum
- Change meshes in two minutes to begin new jobs
- Adhesive free
- The support for the mesh panels that fold and store 18 units in the space needed for 1 standard metal frame
- More sustainable than standard frame systems
- Available in standard sizes: 20x24", 23x31", 25x36"
